****What is Photosynthesis?****

Photosynthesis is the process by which plants, algae, and some bacteria convert light energy into chemical energy.

****The Basic Equation:****

The overall chemical equation for photosynthesis is:

6CO_2 (Carbon Dioxide) + $6\text{H}_2\text{O}$ (Water) + Light Energy \rightarrow $\text{C}_6\text{H}_{12}\text{O}_6$ (Glucose) + 6O_2 (Oxygen)

* ****Reactants:**** Carbon dioxide, water, and light energy

* ****Products:**** Glucose (a sugar) and oxygen

****Where Does Photosynthesis Occur?****

In plants and algae, photosynthesis takes place in ****chloroplasts****. These are specialized organelles.

* ****Chloroplast Structure:****

* ****Thylakoids:**** Internal membrane-bound sacs that contain chlorophyll.

* ****Grana (singular: granum):**** Stacks of thylakoids.

* ****Stroma:**** The fluid-filled space surrounding the thylakoids. The light-independent reactions occur here.

* ****Chlorophyll:**** The green pigment that absorbs light energy. There are several types, with chlorophyll a being the most common.

****The Two Main Stages of Photosynthesis:****

Photosynthesis is divided into two main stages:

1. ****Light-Dependent Reactions (Light Reactions):****

* ****Location:**** Thylakoid membranes of the chloroplasts.

* ****What Happens:**** Light energy is absorbed by chlorophyll and other pigments.

* **Electrons (e^-):** These are used to power the electron transport chain.

* **Protons (H^+):** These contribute to a proton gradient that drives ATP synthesis.

* **Oxygen (O_2):** Released as a byproduct. This is the oxygen we breathe.

* ****Key Products:****

* ****ATP (Adenosine Triphosphate):**** An energy-carrying molecule.

* ****NADPH:**** Another energy-carrying molecule and a reducing agent.

* ****Oxygen (O_2):** A byproduct.

2. ****Light-Independent Reactions (Calvin Cycle or Dark Reactions):****

* ****Location:**** Stroma of the chloroplasts.

* ****What Happens:**** The ATP and NADPH produced in the light-dependent reactions are used to power the Calvin cycle.

* ****Key Steps in the Calvin Cycle:****

* ****Carbon Fixation:**** CO_2 is incorporated into an organic molecule.

* ****Reduction:**** The resulting molecule is reduced using ATP and NADPH.

* ****Regeneration:**** Some G3P is used to regenerate RuBP, allowing the cycle to continue.

* ****Key Product:****

* ****G3P (Glyceraldehyde-3-Phosphate):**** A three-carbon sugar that can be used for energy or to make glucose.

****Factors Affecting Photosynthesis:****

Several factors can affect the rate of photosynthesis:
